WHAT IS SENTI-BI?

SentiBI is a proposed AI-powered Business Intelligence (BI) assistant that helps people move from raw spreadsheet data to clearer, more useful business insights. Instead of switching between separate tools for data inspection, basic analysis, charts, customer feedback and recommendations, users can begin that workflow in one guided workspace.

The product is broader than sentiment analysis. Sentiment is one capability that becomes useful when a dataset contains customer reviews, survey responses, support tickets or other written feedback. SentiBI is intended to support a wider data-to-decision process

Understanding the Platform

THE PROBLEM IT AIMS TO SOLVE

- Spreadsheet data can be difficult to assess quickly, especially when columns are inconsistent, incomplete or poorly documented.
- Analysts often repeat time-consuming preparation and exploration tasks before they can focus on interpretation.
- Business users may see charts or metrics without understanding the assumptions, definitions or limitations behind them.
- Customer feedback can contain useful signals, but reading and grouping large volumes of text manually takes time.
- Insights are less useful when they are not connected to practical next steps and clear human review.

THE OPPORTUNITY

Make the first stages of analysis more accessible and consistent, while keeping the analyst responsible for quality, interpretation and decisions.

WHO IS SENTIBI CREATED FOR?

SentiBI is designed for teams that use spreadsheet data to understand performance, customers and operations. The first prototype is best suited to exploration and demonstration; production use would require further testing, security controls and integration work.

USER GROUP	HOW SENTI-BI COULD HELP
Business / data analysts	Speed up initial profiling, identify issues, explore patterns and prepare a starting point for deeper analysis.
Small-business owners and managers	Understand basic performance indicators and see questions worth investigating without needing to build every analysis from scratch.
Customer experience teams	Review themes in customer comments, complaints, surveys and service interactions.
Operations and service teams	Spot recurring issues in records and compare patterns across categories or time periods when suitable fields are available.
BI and reporting teams	Use suggested field roles and a model outline as a starting point for a governed Power BI workflow.

CORE FEATURES

01 Spreadsheet upload and preview	Import Excel or CSV data, inspect column names and preview records before analysing.
02 Data quality checks	Surface missing values, exact duplicate rows, blank rows and basic column profiles to help users decide what needs attention.
03 Field-role suggestions	Suggest whether columns look like identifiers, dates, text, categories or numeric measures. Users can adjust the suggested roles
04 KPI and model guidance	Suggest possible measures, dimensions and a basic model outline. Business definitions and relationships still need to be validated.
05 Sentiment and text exploration	Apply transparent keyword-based sentiment rules to text, show recurring terms, and allow an analyst to override individual labels.
06 Interactive dashboard	Display high-level record counts, numeric summaries, category breakdowns and sentiment patterns.
07 Findings and next steps	Turn observed patterns into investigation prompts and possible actions, with explicit cautions against treating correlation as proof of cause.
08 Analyst review centre	Track validation tasks, document assumptions and download analyst notes or an executive briefing.

HUMAN-IN-THE-LOOP BY DESIGN

SentiBI should help analysts spend less time on repetitive preparation and more time asking the right questions. The prototype therefore includes places where a person can review the system's suggestions rather than accept them blindly.

Where the analyst stays in control

- Field roles can be changed when the system misunderstands a column.
- Sentiment labels can be overridden record by record.
- Low-confidence or ambiguous feedback can be prioritised for human review.
- Suggested KPIs and model structures are labelled as proposals, not certified definitions.
- Recommendations are written as hypotheses to investigate, not proven causes.
- Analysts can record assumptions and validate source data before sharing results.

Why this matters

Automated systems can misread context, sarcasm, local expressions, unusual data formats or business-specific terms. A number can also look precise while being based on an incorrect definition. Review and transparency reduce the risk that a convenient output is mistaken for a reliable conclusion.

THE WORKING RELATIONSHIP

AI prepares the first draft of the analysis. The analyst checks the evidence and context. The business owner decides what action to take.

HOW IT WORKS

01 Upload	The user selects an Excel workbook or CSV file and chooses the dataset to explore.
02 Profile	SentiBI previews records, detects columns and produces first-pass checks for missing values, duplicates and field types.
03 Map	The user reviews suggested field roles and confirms which fields represent dates, categories, measures or text.
04 Analyse	SentiBI creates basic summaries and, when written feedback is present, applies simple sentiment rules and highlights recurring terms.
05 Explore	Charts and tables help the user compare the patterns visible in the data.
06 Investigate	Suggested findings point to questions that may deserve follow-up, such as a high frequency of complaints or missing values in an important field.
07 Validate	The analyst reviews source records, corrects labels, checks definitions and records assumptions.
08 Share	The user can export data, a model-outline JSON file, notes or a text briefing for further work.

FROM SPREADSHEET TO BUSINESS INSIGHT

Make your data easier to understand.

Bring your data into one workspace, spot quality issues, explore performance, review AI-assisted sentiment, and turn findings into practical next steps. **You stay in control.**

Human-in-the-loop by design

AI prepares the work. You inspect the evidence, correct the analysis, and make the business decision.

1 · Data upload

2 · Data quality

3 · Model & KPIs

4 · Sentiment

5 · Dashboard

6 · Recommendations

7 · Analyst review

Analyst review centre

Your validation checklist before sharing results

Review checklist

Mark each item only after you have checked it.

☐ Source and reporting period confirmed

☐ Missing values and duplicates reviewed

☐ Metric definitions and units confirmed

☐ Identifiers and potential relationships validated

☐ Sentiment labels and low-confidence rows reviewed

☐ Findings checked against business context

Analyst notes

Record assumptions, definitions, and decisions that should not be automated away.

Example: Confirm whether refunds are netted off revenue before calculating margin...

Download notes

Do not publish sensitive customer data or unvalidated AI-assisted conclusions. Confirm access, definitions, and business context with the appropriate owner.
